

ABSTRACT OF THE DISCLOSURE

A method for graphically indicating the positions of nodes connected to an ad hoc network is described. The method permits graphic display of the positions of the configured nodes including at least a node having a position-information detection device such as a GPS receiving device and a node having no such device for detecting its own position information, the graphic display being accomplished based on position information obtained by the detection device and on routing information about the node with no position-information detection device.
